Why Go Wireless?
Learn about the many benefits of Wireless Access Control

- Significantly faster installation and deployment
- Significantly lower installation costs
- Ability to install locks on glass or aesthetically, architecturally or historically significant doors
- Ability to avoid disruption or damage surrounding stone, concrete, cinderblock, brick, granite, marble and similar adjacent wall materials
- Ability to add security to non-traditional openings
  - Drug cabinets
  - HIPAA, HR and other confidential, restricted document file cabinets
  - Evidence lockers; utility and equipment closets
  - Data center/server cabinets
  - Other high risk openings
- Superior future proofing
  - Ability to quickly, conveniently and cost-effectively add doors to the system, even one at a time
  - Support for high security identity credentials (traditional, mobile, and other emerging technologies)

Depending on which wireless electronic access control technology is chosen, the benefits offered over wired solutions can include:
Why Go Wireless?
Learn about the many benefits of Wireless Access Control

- The ability to pay only for what is used
  - Controllers for wired solutions are often based on openings in specific multiples of 2, 8, 16, 32 or even 64 doors. Wireless technology can allow users to better match specific capacity needs, and avoid overspending on hardware costs and ongoing software licensing fees
- Lower power costs
  - Since wireless locks are powered by off-the-shelf, low-cost batteries that last for years and only operate when a credential is presented or an update is pushed, they can consume a fraction of the power used by “always on” wired locks running on costly building electricity
- Lower storage and infrastructure costs
  - Wireless EAC often eliminates the need for large panels and controllers that consume real estate in already congested utility rooms and IDF (intermediate distribution frame) closets, and must be continually monitored and maintained
- The ability to cost-effectively extend the network to outdoor remote locations, such as security entry gates and parking facilities, without costly and disruptive trenching
